

Feeding

The park’s marshes produce enough insects and invertebrates to sustain a diverse bird community. Waders such as the Great Blue Heron and Yellow-crowned Night-Heron stalk prey in the marshy guts while the Spotted Sandpiper feeds from the muddy creek bank. The Virginia Rail is not common, but it forages here during migration. More often heard than seen, the Clapper Rail is a year-round inhabitant of the marsh where it searches for mussels and fiddler crabs.

The forests provide many seeds, berries, and insects. In the summer, birds such as the abundant Red-eyed Vireo glean insects from the foliage of mature hardwoods. Others such as the White-breasted Nuthatch prefer searching for prey beneath tree trunk bark. Berries of the American Holly, Red Cedar, and Greenbrier are particularly important to migrating thrushes in the fall. Trumpet vine provides nectar for the Ruby-throated Hummingbirds.

Breeding

During the breeding season, the forest resounds with the territorial songs of birds from the tropics such as warblers, vireos, and tanagers. Each paired male sings a warning to others of its species to keep away. Its mate is probably brooding on their nest nearby. Both species of tanager can be heard singing high in the white oak canopy.

Several warblers breed at New Quarter Park including Northern Parula, and Hooded, Yellow-throated, and Kentucky Warblers. Common Yellowthroats find the marshes particularly accommodating for nesting and raising young.

Quite unique are the small Seaside Sparrows which breed along Queen’s Creek, perhaps one of the western-most locations for these birds in the region.

Early in the breeding season, male American Woodcocks perform their high-spiraling courtship display at dusk and dawn. Listen for their high-pitched whistles as they dive.

Migration

The forests and marshes at New Quarter are never more active than during migration. All seven eastern thrushes and more than 20 warbler species pass through. It is not uncommon to encounter more than 70 species in a morning of casual birding.

Many of these forest birds are neotropical migrants – birds arriving from or going to Central and South America and the Caribbean islands. Many rest and refuel in the New Quarter Park woods before moving on. Some species, such as the Red-eyed Vireo, Ovenbird, and Wood Thrush, remain to breed. For those species only passing through, the greatest numbers stop at New Quarter from mid-April through mid-May and from late September through October.

Other common migrants include short-distance migrants such as Swamp Sparrow and Winter Wren that don’t winter as far away as warblers and vireos. Short-distance migrants appear earlier in the spring and later in the fall than other migrating birds.

Wintering

Many interesting birds winter near Queen’s Creek thanks in part to the area’s unique topography. The Blue-headed Vireo, which usually winters farther south, may be seen at here in the winter. The Red-breasted Nuthatch finds the tall pines and old hardwoods good places to forage and seeks shelter in them during the cold season. Above the marsh, Northern Harriers glide in search of prey among the dead grasses. Bald Eagles frequent New Quarter throughout the year. They are often seen perched on snags and tall trees while looking out at the river.

The most abundant winter birds are common throughout the area. The numbers of Yellow-rumped Warblers and Golden-crowned Kinglets can be astounding. Other common species include the Carolina Chickadee, Carolina Wren, Cedar Waxwing, and White-breasted Nuthatch, White-throated Sparrow, and Dark-eyed Junco.

Leave Your Data

Use the checklist provided to record the number of birds of each species that you see while visiting New Quarter Park. Please leave your list at the Park Office so that we may add your bird sightings and contact information (optional) to our database.

The Williamsburg Bird Club meets at New Quarter Park on the second and fourth Saturdays of each month. Visit www.wmbgbirdclub.com for information on start times and bird walk leaders.

For more information or to reserve New Quarter Park facilities for group events, call York County Parks and Recreation at 757-890-3500.

Bird Watching at New Quarter Park

The variety of birds at the park reflect its diverse habitats.

Tidal Wetlands

The Park is bounded to the west by Queen’s Creek and to the east by Cub Dam Creek, both tidal tributaries of the York River, which is nested in Chesapeake Bay estuary. The creeks and marshy flats support a community of birds living in the grasses and trees adjacent to the creeks. Key species include Great Blue Heron, Great Egret, Yellow-crowned Night-Heron, Osprey, American Bald Eagle, Clapper Rail, and Seaside Sparrow.

Mature Hardwoods

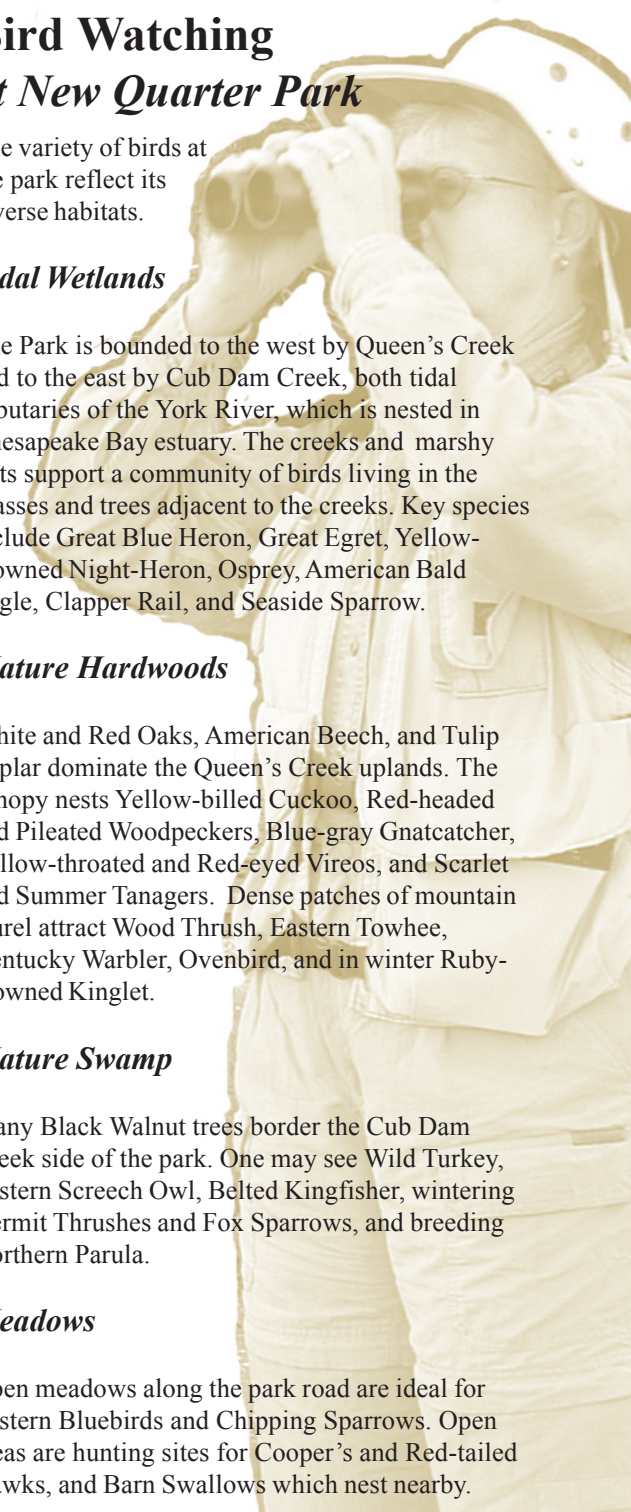

White and Red Oaks, American Beech, and Tulip Poplar dominate the Queen’s Creek uplands. The canopy nests Yellow-billed Cuckoo, Red-headed and Pileated Woodpeckers, Blue-gray Gnatcatcher, Yellow-throated and Red-eyed Vireos, and Scarlet and Summer Tanagers. Dense patches of mountain laurel attract Wood Thrush, Eastern Towhee, Kentucky Warbler, Ovenbird, and in winter Ruby-crowned Kinglet.

Mature Swamp

Many Black Walnut trees border the Cub Dam Creek side of the park. One may see Wild Turkey, Eastern Screech Owl, Belted Kingfisher, wintering Hermit Thrushes and Fox Sparrows, and breeding Northern Parula.

Meadows

Open meadows along the park road are ideal for Eastern Bluebirds and Chipping Sparrows. Open areas are hunting sites for Cooper’s and Red-tailed Hawks, and Barn Swallows which nest nearby.

Canada Goose
